FOOD AND DRUG ADMINISTRATION
APPROVED PRESCRIPTION DRUG PRODUCTS
- With Proposed Therapeutic Equivalence Evaluations -

I. PREFACE

A: INTRODUCTION

This volume provides a complete list of prescription drug products that have been specifically approved for marketing by the Food and Drug Administration (FDA). In addition, it contains proposed evaluations of therapeutic equivalence for certain of these drugs. These evaluations have been prepared to promote public education in the area of product selection, to foster containment of health costs, and to serve state health agencies in the administration of their laws relating to generic substitution. The criteria for therapeutic equivalence evaluations, and the evaluations themselves for specific drugs, are presented as proposals rather than final Agency determinations so that interested parties may review and comment on them. FDA desires that the list be as well informed as possible because of the public interest in it and the importance of the information it contains. A more complete discussion of the background and basis of the Agency's proposed policies relating to therapeutic equivalence of drug products and of the procedures for submitting comments on these policies are contained in an announcement published in the Federal Register of January 12, 1979. All information in this list is public and available under the Freedom of Information Act.

For several years there has been a trend toward repeal of anti-substitution legislation that once was common in most states. In addition, a number of states have recently adopted laws intended to encourage the substitution of one product of a particular drug entity for another, with the intent of saving money for the consumer and containing costs in drug procurement and medical reimbursement programs. These state laws generally require that either substitution be limited to drugs on a specific list (the positive formulary approach) or that substitution be permitted for all drugs except those prohibited by a particular list (the negative formulary approach).

A number of states have sought the assistance of the FDA in preparing both positive and negative formularies. For example, on January 23, 1978 the FDA responded to a request from the New York State Health Department to evaluate for therapeutic equivalence their list of drug products. Subsequently, a similar evaluation was made of a list submitted by the State of Illinois. The basic policies applied in evaluating these lists for the states of New York and Illinois were identical to the policies applied in developing this list.

Because of the number of requests for assistance in developing drug lists from other states, it became apparent that FDA could not serve the needs of each state on an individual basis. The Agency also recognized that a single list based on common policies would be preferable to attempting to evaluate drugs on the basis of somewhat differing definitions and criteria in various state laws. As a result, on May 31, 1978, FDA Commissioner Donald Kennedy sent a letter to officials of all states informing them of FDA's intention to prepare a list of all prescription drug products that are approved by the FDA for safety and effectiveness, and, in the case of multisource products, those products containing the same active ingredients that the Agency considers to be therapeutically equivalent.

An evaluation of therapeutic equivalence is a scientific judgment based upon evidence, while generic substitution is a social and economic policy intended to minimize the cost of drugs at the consumer level. The FDA proposes to consider products to be therapeutically equivalent if they meet the policies outlined in this document, even though they may differ in certain other characteristics, e.g., color, flavor, packaging, expiration time and minor aspects of labeling. When such differences are important in the care of a particular patient, it is appropriate for the prescribing physician to require that a particular brand be dispensed as a medical necessity. In other instances, however, the FDA believes that products considered therapeutically equivalent can be substituted with full expectation that the substituted product will produce the same therapeutic effect as the prescribed product.

B. DEFINITIONS

Pharmaceutical Equivalents - Drug products are pharmaceutical equivalents if they contain the same active ingredients and are identical in strength, dosage form and route of administration (e.g., chlorthalidone HCl, 5 mg. capsules, made by two or more different manufacturers). Pharmaceutically equivalent drug products were formerly called chemical equivalents. They are formulated to contain the same amount of active ingredient in the same dosage form and to meet the same or comparable standards, but they may differ in characteristics such as color, taste, shape, packaging, expiration time, and, within certain limits, labeling.

Pharmaceutical Alternatives - Drug products are considered to be pharmaceutical alternatives if they contain the same therapeutic moiety but differ in the salt or ester of that moiety or in the dosage form or strength (e.g., tetracycline hydrochloride, 250 mg. capsules, vs. tetracycline phosphate complex, 250 mg. capsules; diazepam, 2 mg. tablets vs. diazepam, 10 mg. tablets). Different dosage forms and strengths within a product line by a single manufacturer are thus pharmaceutical alternatives, as are controlled release products when compared with standard formulations of the same active ingredient.

Therapeutic Equivalents - Drug products are considered to be therapeutic equivalents if they are pharmaceutical equivalents and can be expected to give the same therapeutic effect when administered to the patient under the conditions specified in the labeling. The concept of therapeutic equivalence, as used in developing these lists, applies only to products containing the same active ingredients and does not encompass a comparison of pharmaceutical alternatives or two different active ingredients used for the same disease (e.g., propoxyphene HCl and pentazocine for the treatment of pain).

Approved Drug Products - This term refers to those drug products manufactured or distributed under new drug applications (NDA's) or abbreviated new drug applications (ANDA's) approved by the Food and Drug Administration under the provisions of section 505 of the Federal Food, Drug, and Cosmetic Act, or in the case of antibiotics, under analogous applications known as Form 5's or Form 6's, which are approved under section 507 of the Act. Any drug product on this list with an approved NDA, ANDA, Form 5, or Form 6 has been fully reviewed and approved for safety and effectiveness by the FDA. The law also permits drugs to be legally marketed without such fully approved applications under certain circumstances, but the drugs so marketed do not appear on this list. They consist primarily of: 1) drugs marketed prior to 1938 that are not subject to the pre-market clearance procedures of the law, and 2) drug products marketed between 1938 and 1962 that were approved for safety but not effectiveness and are being reviewed under the administrative procedures of the Drug Efficacy Study Implementation (DESI) process. These drugs still in the DESI administrative process are listed in the appendix to the list. Approved drugs constitute about 75% and non-approved drugs about 25% of the wholesale dollar volume of prescription drugs in the United States.

C. GENERAL POLICIES GOVERNING THE LIST

The fundamental proposed policy governing this list is that the FDA considers pharmaceutically equivalent drug products to be therapeutically equivalent providing they are approved for both safety and effectiveness, are manufactured in accordance with Current Good Manufacturing Practice Regulations, meet the same or equivalent standards, and, in those instances where positive evidence of bioavailability is necessary, are shown to be bioequivalent to an appropriate standard. The Agency believes this policy to be consistent with the prevailing opinion of experts and with general experience in the marketplace through the years.

The Agency has considered, and rejected, the option of requiring in vivo bioavailability studies for every product. Such a policy would result in the testing in humans of a large number of products for which there is no evidence of a bioavailability problem, and would thereby waste the

nation's clinical research resources on the repetitive testing of drug products for little or no scientific purpose. For this reason, the FDA has elected under its bioavailability and bioequivalence regulations to confine in vivo testing of products for bioavailability to those particular drugs for which such testing is scientifically and medically necessary. The FDA has also considered, and rejected, the options of evaluating for therapeutic equivalence, drugs legally marketed without approved applications and drugs still under review in the DESI process. Although such products are required to be manufactured under the Current Good Manufacturing Practice Regulations and to meet USP or other official specifications, the effectiveness of the active ingredient or combination of ingredients in these products has not been fully evaluated. The Agency is not proposing to evaluate the therapeutic equivalence of products when the basic issue of their effectiveness is still in doubt.

In considering the therapeutic equivalence of drugs with known or potential bioavailability problems, the Agency has followed a policy of evaluating as therapeutic equivalents only those products that have met current requirements (in vivo testing in humans, in vitro dissolution rate requirement, or both, depending on the drug). When bioavailability or bioequivalence requirements are newly established, there is a transition period during which all manufacturers are permitted to submit information regarding their products. For this reason some manufacturers whose products may not have yet met the requirement are still legally marketed.

In constructing this list, the FDA has evaluated for therapeutic equivalence only multisource drug products, i.e., those pharmaceutical equivalents available from more than one manufacturer. For all multisource products a therapeutic equivalence code is included and, in addition, those proposed as therapeutically equivalent are highlighted in bold face and underlined. In each case, the reason for the FDA proposal is given by an appropriate code. Those products with approved applications that are single source are listed for the sake of completeness, but no therapeutic equivalence code is included with such products. The details of these codes and the policies underlying them are outlined below.

The FDA emphasizes that the decision not to evaluate certain pharmaceutically equivalent products as therapeutically equivalent does not necessarily imply that such products are known to be inequivalent. In most cases, lack of necessary information supporting therapeutic equivalence, not positive information of inequivalence, is the underlying reason for the decision.

D. PRECAUTIONS TO USERS OF THE LIST

1. Need for usual professional care and performance in using the list.

The evaluations of therapeutic equivalence in this list are scientific and medical evaluations by FDA. Products proposed as therapeutically

equivalent can be expected, in the judgment of the FDA, to have equivalent therapeutic effect and equivalent potential for adverse effects when used under the conditions of labeling. However, these products may differ in other characteristics, for example in taste, color, packaging, expiration time, and, in some instances, labeling. If such products are substituted for each other, there is a potential for problems such as patient confusion due to differences in color or shape of tablets, better patient acceptance of certain products because of flavor, better stability of one product over another under adverse conditions of storage, or allergic reactions in rare individuals due to a coloring ingredient, as well as the potential for reduced cost to the patient. An FDA evaluation of therapeutic equivalence in no way relieves practitioners of their professional responsibilities in prescribing and dispensing such products with due care to individual patients. In those uncommon circumstances where the characteristics of a specific product, other than its active ingredient, are important in the therapy of a particular patient, the physician's specification of that product is appropriate. Pharmacists must also be familiar with the expiration times and labeling conditions for storage, particularly for reconstituted products, to assure that patients are properly advised when one product is substituted for another.

2. Not all drugs on the list are necessarily marketed.

The inclusion of a drug product on this FDA list does not necessarily mean that it is being marketed at the present time. The list reflects the products that have been approved for marketing under sections 505 and 507 of the Act. A manufacturer may, however, withdraw any of its products from active marketing at any time, while still maintaining an active application in FDA files. The Agency, in cooperation with manufacturers, seeks to terminate approvals for products that are not intended to be remarketed in the future. FDA files are, therefore, not generally out-of-date, and the Agency believes that most of the products in this list are marketed at the present time. Nevertheless, some products included in the list may not actually be available for purchase. On the other hand, those few products that are approved but that are marketed only for export, are not included in the list.

3. Distributors are not included in the list.

This list identifies only the holder of the approved application in FDA files. While the application holder is usually the manufacturer, there may be instances where the application holder is not the manufacturer. More frequently, however, approved products are manufactured for, or purchased and repackaged or relabeled by, distributors who in turn market these products under other labels. These labels may or may not identify the actual manufacturer of the drug product. Because these distributors often shift their sources of supply in the commercial marketplace, there is no feasible way for FDA to maintain an up-to-date and complete list either linking every approved manufacturer with the distributors currently handling its product or linking each distributor

with its current suppliers. Purchasers and dispensers wishing to know the manufacturing source of a particular batch offered by a distributor must rely upon the distributor to disclose such information, either in the labeling or otherwise. Disclosure of the actual manufacturer is not required by Federal law. Absent voluntary labeling or disclosure, there is no way for a purchaser or dispenser to verify that the distributor's products were manufactured under an approved New Drug Application or are therapeutically equivalent to competing products of other manufacturers.

4. Any product on this list is subject at all times to regulatory action.

From time to time approved products may be found to be in violation of one or more requirements of the Act. In such circumstances, the Agency will commence appropriate enforcement action to remove the violative product from the market, e.g., by voluntary recall or seizure. If the problem leading to the violation is continuing, so that there exists a risk of future non-complying products entering the market, FDA will undertake steps to eliminate that risk, e.g., by court injunction, withdrawal of the approval of the New Drug Application, or revocation of the antibiotic certification. Where the violation is corrected by removal of the particular batch of the product from the market, no need exists to exclude the product from this list; the approval continues and other batches are not tainted. Where additional preventive action is indicated, the Agency will utilize appropriate legal procedures to keep the product off the market. Such regulatory action, however, is independent of the inclusion of products in the list. The sole criterion for inclusion of products in the list is their being the subject of an approved application. Products will not be removed from the list until completion of FDA proceedings to withdraw approval of the product under section 505 or 507, as applicable. The FDA believes that retention of a violative product on the list will not have any adverse health consequences because other legal tools are available to the Agency to prevent actual marketing of violative products.

E. CODES AND SPECIFIC POLICIES FOR THERAPEUTIC EQUIVALENCE EVALUATIONS

The coding system is constructed to allow users to determine quickly whether the Agency has evaluated a particular approved product as therapeutically equivalent to other pharmaceutically equivalent products. The coding system is also intended to provide specific information on the basis for the FDA's evaluations. Therapeutic equivalence coding has been applied only to multisource drugs. There are basically two classification categories into which all of the multisource drugs have been placed, as follows:

- A - Drug products that the FDA considers to be therapeutically equivalent to other pharmaceutically equivalent products.

II. LISTINGS

A. FORMAT GUIDE

This publication contains the Drug Product List, three other lists or indices which facilitate its use, and an appendix, all of which are described below.

1. Drug Product List

The Drug Product List contains product identification information (dosage forms, routes of administration, trade or generic names, manufacturers, strengths) for single and multiple ingredient drug products arranged alphabetically by active ingredient.

Product information for multiple ingredient products is listed under the alphabetically first active ingredient. For example, Lidocaine with Epinephrine appears under Epinephrine; Lidocaine Hydrochloride. A cross-reference to the product information appears for each additional active ingredient in the product.

If a product is multisource, a therapeutic equivalence code (TE Code) will appear in front of the manufacturer's name. If a product is therapeutically equivalent to one or more competing products, it will be designated with a TE Code beginning with A, and the entry will be underlined and printed in bold font.

To improve readability, standardized terms are used to designate dosage forms, routes of administration, and strengths. In some cases, the standardized terms used may differ from label wording.

Available strengths of a dosage form are separated by asterisks. For combination products, the ingredient strengths of a product are separated by semicolons and appear in the same relative sequence as do the ingredients in the heading.

To use the Drug Product List, determine the ingredient under which the product information is listed, using the Trade Name Index if appropriate. Then, find the ingredient in the Drug Product List. Proceed to the dosage form; route(s) of administration and compare products within that heading only. Therapeutic equivalence or inequivalence then is determined on the basis of TE Codes and underlining/bolding within that specific dosage form heading. For further clarification see the annotated examples at the end of this section.

2. Application Holder Index

The Application Holder Index is an index of products by manufacturers. It also indicates the ingredient under which product information can be found in the Drug Product List.

3. Trade Name Index

The Trade Name Index is a list of products by trade name or generic name. It also indicates the ingredient under which product information can be found in the Drug Product List.

4. Application Holder Abbreviation List

The Application Holder Abbreviation List is an index of the manufacturer name abbreviations used in the lists.

5. Approved Drug Products Pending Resolution of Safety or Effectiveness Issues

All of the drug products in this appendix were originally approved for safety between 1938 and 1962. They do not appear in the Drug Product List because they have not received a final determination of effectiveness under the Drug Efficacy Study Implementation (DESI) review, or were not reviewed under DESI but are under evaluation by the Agency for effectiveness or safety issues. They are listed alphabetically by trade name. The manufacturer's name and active ingredients are also included.

The appendix is divided into the following classifications:

CURRENT STATUS - PROBABLY EFFECTIVE - Products that were evaluated by the National Academy of Sciences, National Research Council (NAS/NRC) and found to be probably effective and to require additional evidence to substantiate labeling claims.

CURRENT STATUS - POSSIBLY EFFECTIVE - Products that were evaluated by NAS/NRC and found to be possibly effective and to require additional evidence to substantiate labeling claims.

CURRENT STATUS - INEFFECTIVE - Products that were evaluated by NAS/NRC and found to lack evidence of effectiveness. These products are awaiting completion of administrative proceedings.

CURRENT STATUS - INEFFECTIVE/NEW SAFETY ISSUE - Products that were evaluated by NAS/NRC and found to lack substantial evidence of effectiveness as a fixed combination and to present a safety issue. These products are awaiting completion of administrative proceedings.

CURRENT STATUS - "EXEMPT" (COURT ORDER) - Products that are subject to paragraph XIV of Federal District Court Judge Wm. B. Bryant's order as published in the Federal Register of December 14, 1972 (37 FR 26623). These products were evaluated by NAS/NRC and found to be less than effective, but a decision on whether to remove them from the market is deferred pending completion of additional clinical studies.

NON-DESI DRUGS - SAFETY TO BE DETERMINED - Products that were not reviewed by NAS/NRC and which have been found to present a safety issue. These products are awaiting completion of administrative proceedings.

CURRENT STATUS - EFFECTIVENESS TO BE DETERMINED - Products that were not reviewed by NAS/NRC and which are undergoing Agency evaluation for effectiveness.

MCI	MILLICURIE		

administration. For example, a particular brand of an antibiotic might require administration on an empty stomach, while another brand might permit administration without regard to food intake on the basis of blood level studies done after administration in the presence of food. An FDA evaluation of therapeutic equivalence in such cases is applicable only when such products are taken in accordance with labeling directions for the particular product.

3. In some cases closely related products are listed as containing the same active ingredient but in somewhat differing amounts. In determining which of these products are pharmaceutically equivalent, the Agency has employed a criterion that products with labeled strengths of an ingredient that do not vary by more than 1% will be considered pharmaceutically equivalent.

4. Different salts and esters of the same therapeutic moiety are regarded as pharmaceutical alternatives. Such products are not considered to be therapeutically equivalent. There are no known instances in this list where pharmaceutical alternatives are coded as therapeutically equivalent. Anhydrous and hydrated entities have been considered as pharmaceutical equivalents, as in the case with ampicillin.

5. Vials containing solids for reconstitution, solutions or concentrated solutions for dilution, and with different concentrations of an active ingredient, are not considered as pharmaceutical equivalents. However, this decision should not be construed as preventing the exercise of accepted professional practice to render pharmaceutically different concentrations equivalent (e.g., diluting more concentrated solutions using proper procedures to ensure maintenance of the quality of the product).

6. Where package size variations have therapeutic implications, products so packaged have not been considered pharmaceutically equivalent. For example, some oral contraceptives are supplied in 21 and 28 tablet packets, the 28 tablet packets containing 7 placebo tablets. These two packaging configurations are not regarded as pharmaceutically equivalent and thus not therapeutically equivalent.

The specific sub-codes for those drugs evaluated as therapeutically equivalent and the policies underlying these codes are listed below:

AA Products Not Presenting Bioequivalence Problems, in Conventional Dosage Forms

Products coded as AA are standard formulations of those active ingredients that are not regarded as presenting either actual

- B - Drug products that the FDA is unable to recommend at this time as therapeutically equivalent to other pharmaceutically equivalent products.

A two-letter code is used in the list. The first letter is the basic classification (A or B) to which an individual drug product has been assigned. The second letter in the code designates a more specific reason for placing the individual product in that category. The codes are explained in this section of the preface. Individual drug products have been evaluated as therapeutically equivalent in accordance with the definitions and policies outlined below.

- A - Drug products that are considered to be therapeutically equivalent to other pharmaceutically equivalent products.

Drug products designated with an A code fall under one of two main policies. For those active ingredients for which no bioequivalence issue is known or suspected, therapeutic equivalence of pharmaceutically equivalent products is presumed, so long as the products are manufactured in accordance with Current Good Manufacturing Practice Regulations and meet the other requirements of their approved applications. For those drug products containing active ingredients which have been identified by FDA as having actual or potential bioequivalence problems (21 CFR 320.22 or 42 FR 1648, January 7, 1977), an evaluation of therapeutic equivalence is assigned to pharmaceutical equivalents only if the approved New Drug Application contains adequate scientific evidence supporting the bioequivalence of the product to a selected standard product. This evidence may be an in vivo bioavailability study or an in vitro dissolution rate study, or both, depending upon the drug.

There are some general principles which may affect the substitution of pharmaceutically equivalent products in some specific cases. Prescribers and dispensers of drugs should be alert to these principles so as to deal appropriately with these situations which require professional judgment and discretion.

1. There may be labeling differences among pharmaceutically equivalent products which require attention on the part of the health professional. For example, pharmaceutically equivalent powders to be reconstituted for administration as oral or injectable liquids may vary with respect to their expiration time or storage conditions after reconstitution. An FDA evaluation that such products are therapeutically equivalent is applicable only when such products are reconstituted, stored and used under the conditions specified in the labeling of each product.
2. Occasionally there may be variation among pharmaceutically equivalent products in the labeling instructions on dose and

or potential bioequivalence problems. In addition, the drug products of the active ingredient are manufactured in dosage forms not presenting bioequivalence problems, such as plain tablets, capsules, solutions, elixirs, syrups, and tinctures.

AB. Products Meeting Necessary Bioequivalence Requirements

The AB evaluation denotes products that contain an active ingredient in a dosage form that is subject to a bioequivalence requirement, or for which the submission of bioavailability data is required for approval, and for which the manufacturer has provided adequate studies to support the bioavailability and bioequivalence of its product. This category also includes those few drugs with more than one application holder but only one manufacturer. If only one product of a drug ingredient heading is coded AB, it signifies that only that product is supported by bioavailability data. It does not signify, however, that this product is therapeutically equivalent to any other under the same heading.

AN Solutions and Powders for Aerosolization

Uncertainty regarding the therapeutic equivalence of aerosolized products arises primarily because of differences in the drug delivery system. Powders or solutions for aerosolization which are marketed for use in any of several delivery systems are considered to be pharmaceutically and therapeutically equivalent and are coded AN. Those products compatible only with, or which are a component of, a specific delivery system are classified BN, because drug products in their respective delivery systems are not necessarily pharmaceutically equivalent and therefore not therapeutically equivalent.

AO Injectable Oil Solutions

The absorption of drugs in injectable oil solutions may vary substantially with the type of oil employed as a vehicle and the concentration of the active ingredient. Injectable oil solutions are therefore considered to be pharmaceutically and therapeutically equivalent only when the active ingredient, its concentration, and the type of oil used as a vehicle are all identical.

AP Aqueous Injectable (Parenteral) Solutions

All injectable products are listed under the general category Injectable; Injection, but specific routes of administration are not shown. Some multisource products that are pharmaceutical equivalents are labeled by their different manufacturers for different routes of administration. Injectable

products available as dry powders for reconstitution, concentrated sterile solutions for dilution, or sterile solutions ready for injection, are all considered to be pharmaceutically and therapeutically equivalent provided they are designed to produce the same concentration for injection and are similarly labeled. Consistent with accepted professional practice, it is the responsibility of the prescriber, dispenser or individual administering the product to be familiar with a product's labeling to assure that it is given only by the route(s) of administration stated in the labeling.

Certain commonly used large volume intravenous products are not included in this list (e.g., dextrose 5% with water, dextrose 10% with water, sodium chloride injection). Virtually all of these drugs came on the market in glass containers before 1938 and were not required to obtain an approved New Drug Application as a condition of marketing. These same drugs when packaged in plastic containers are considered to be new drugs requiring approved new drug applications for marketing. The current list thus includes only those approved solutions in plastic containers. All large volume parenteral products are manufactured under similar standards, regardless of whether they are packaged in glass or plastic. The FDA has no reason to believe that the packaging container of large volume parenteral solutions that are pharmaceutically equivalent would have any effect on their therapeutic equivalence. Nevertheless, because only products with approved applications are on the list, large volume parenterals in glass containers are not included in the evaluations of therapeutic equivalence.

AT Topical Products

There are a variety of dosage forms available for topical, ophthalmic, otic, rectal and vaginal administration, including solutions, creams, ointments, gels, lotions, pastes, sprays, and some suppositories. Different topical dosage forms are not pharmaceutically equivalent, even though they may contain the same active ingredient, and therefore they are not considered therapeutically equivalent. Products in the same topical dosage forms are, however, in the absence of contrary data, considered therapeutically equivalent if they are pharmaceutically equivalent.

B - Drug products that the FDA is unable to recommend as therapeutically equivalent to other pharmaceutically equivalent products.

Certain multisource drugs appearing on the list have been classified with a B code for a variety of reasons. Those drugs that have been identified by the Agency as having potential or actual bioequivalence problems and for which adequate studies demonstrating the bioequivalence of the particular product have not been submitted to FDA are

classified in the B category. Among those active ingredients for which no bioequivalence problem has been identified by the Agency, a B evaluation generally is a result of known or potential problems with the specific dosage form. In addition, there are currently a few products for which the standards are inadequate or for which FDA has insufficient information at the present time to determine if they are therapeutically equivalent.

The specific coding definitions and policies for the B sub-codes are as follows:

BC Controlled Release Tablets, Capsules and Injections

These dosage forms are subject to bioavailability differences, primarily because different firms developing controlled release products for the same active ingredient rarely employ the same approach to formulating their controlled release products. The FDA, therefore, does not consider different controlled release dosage forms containing the same active ingredients in equal strengths as therapeutically equivalent unless equivalence between individual products has been specifically demonstrated through appropriate bioequivalence studies. Controlled release products for which bioequivalence data are available have been coded AB.

BD Active Ingredient and/or Dosage Forms with Documented Bioequivalence Problems

The BD code denotes products containing active ingredients with known bioinequivalence problems, and for which adequate studies have not been submitted to FDA demonstrating the bioequivalence of the drug products. When such studies are available, the product has been coded AB.

BE Enteric Coated Oral Dosage Forms

Products in enteric coated dosage forms containing the same active ingredients are subject to significant differences in absorption. Such products cannot necessarily be considered pharmaceutically equivalent, and few manufacturers of enteric coated products have studied the pharmacokinetics of their products. Unless otherwise specifically noted, the Agency does not consider different enteric coated products containing the same active ingredients as therapeutically equivalent. If studies have demonstrated the equivalence of enteric coated products, such products are coded AB.

BN Products in Aerosol-Nebulizer Drug Delivery Systems

This code is used where the drug solution or powder is sold only as a component of, or is compatible only with, a specific drug delivery system. There may be significant differences between the dose of drug and particle sizes delivered between different products. Therefore, such products are not regarded as pharmaceutically equivalent.

BP Active Ingredients and Dosage Forms with Potential Bioequivalence Issues

FDA's bioequivalence regulations (21 CFR 320.22) identify a set of criteria for determining whether a specific active ingredient in a specific dosage form has a potential for poor absorption. It is FDA's policy to consider an ingredient meeting these criteria as having a potential bioequivalence problem even in the absence of positive data demonstrating inequivalence. Pharmaceutically equivalent products containing these ingredients in oral dosage forms are included in this category pending resolution of their bioequivalence or lack of it.

Injectable suspensions containing an active ingredient suspended in an aqueous or oleagenous vehicle have also been included in this sub-category. Injectable suspensions are subject to bioequivalence problems because of differences in particle size, polymorphic structure of the suspended active ingredient, or the suspension formulation. The FDA does not consider pharmaceutical equivalents of these products as therapeutically equivalent in the absence of evidence of bioequivalence.

BR Suppositories for Systemic Use

The absorption of active ingredients from suppositories that are intended to have a systemic effect (as contrasted with suppositories administered for local effect) can vary significantly from product to product. Therefore, FDA considers pharmaceutically equivalent systemic suppositories as therapeutically equivalent only if positive evidence of bioequivalence is available. In such cases where positive evidence is available, the product is coded AB. If such evidence is not available, the products are coded BR.

BS Products Having Drug Standard Issues

If the drug standards for an active ingredient in a particular dosage form are judged to be inadequate to determine whether the products subject to that standard are pharmaceutical equivalents, all drug products containing that active ingredient in that dosage form are coded BS. For example, if the standards

permit a wide variation in pharmacologically active components of the active ingredient, such that pharmaceutical equivalence is in question, all products containing that active ingredient in that dosage form are coded BS.

BX Insufficient Data

The code BX is assigned to those drug products for which the Agency has insufficient data to determine whether they are therapeutically equivalent under the policies stated in this document. As soon as appropriate information is available for such products, they will be reclassified into the appropriate A or B code.

F. DESCRIPTION OF SPECIAL SITUATIONS

Certain drugs present special situations that deserve a more complete explanation than can be provided by the two-letter codes used in the list. These drugs have particular problems with standards of identity, analytical methodology or bioequivalence that are in the process of resolution. The following are in this category.

1. Chlorothiazide Tablets, 500 mg.

The Agency has identified a batch to batch variability problem with currently approved brands of chlorothiazide 500 mg. tableted products. In addition, there is evidence that this tablet dosage form is not proportional in dosage to the 250 mg. tablet. Firms with approved 500 mg. products and the FDA are carrying out studies to resolve this matter. These products are coded BD.

2. Conjugated Estrogen Tablets

Data have been submitted to the FDA indicating that there are significant differences in blood levels of the active ingredients produced by different conjugated estrogen tablets. These differences could affect therapeutic activity. They are believed to be directly related to the wide range of differences permitted by the current official standards in the several active estrogenic steroids in conjugated estrogen products. FDA is working with the USP to revise the standards of identity for conjugated estrogens. Until such time as the standards issue is resolved, however, FDA is unable to conclude that conjugated estrogen tablets produced by different manufacturers are necessarily pharmaceutical equivalents. These products have thus been coded as BS.

3. Dihydroergotoxine Mesylate (Sublingual) Tablets

Dihydroergotoxine mesylate is composed of three alkaloids consisting of equal parts (one third each) of dihydroergocornine, dihydroergocristine,

and dihydroergocryptine mesylates. Subsequent to completing clinical trials on its product, and as a result of advances in analytical methodology, the original application holder discovered its product contains two forms of dihydroergocryptine mesylate, alpha and beta, in the ratio of 2 to 1 respectively. Other marketed products are chemically similar except for different alpha/beta ratios of dihydroergocryptine mesylate.

While there is no information to indicate that differences in the alpha/beta ratio make a clinical difference, products differing in this respect are not considered pharmaceutical equivalents. The Agency is aware that dihydroergotamine mesylate tablets are being reformulated by a number of manufacturers to meet the same specifications. It appears that the problem will be resolved shortly, but until then, those products are coded BS.

4. Erythromycin (base) Tablets

All manufacturers of erythromycin base tableted products demonstrated the bioavailability/bioequivalence of their products as a condition of application approval. At the time of initial approval all such products were tested under fasting conditions and, as a result, all firms were required to label their products to be taken only under fasting conditions. Since that time, at least one firm has substantially revised its product so that it produces satisfactory blood levels in the presence of food. Thus, the physician and pharmacist must be alert to labeling differences between erythromycin products with respect to administration in the presence of food.

In addition, FDA has received new data which demonstrate the inequivalence of some erythromycin base tablets on a fasting basis. Until this matter is resolved, all erythromycin base tablets have been coded as BX.

5. Erythromycin Stearate Tablets

All manufacturers of erythromycin stearate tableted products demonstrated the bioavailability and bioequivalence of their products as a condition of application approval. These bioequivalence studies were performed under fasting conditions and, as a result, all firms were required to label their products to be taken on an empty stomach. Since that time some firms have demonstrated that their products may be taken immediately before meals, but not with meals, and still achieve acceptable blood levels. On the basis of such studies, FDA has approved those products to be labeled accordingly. At the same time, the Agency stresses that optimal absorption for any erythromycin stearate tablet is achieved when the drug is administered under fasting conditions, and recommends that prescriptions include instructions regarding administration in relation to meals. When erythromycin stearate tablets are to be administered under fasting conditions, the Agency believes that any listed brand coded AB may be used. If erythromycin stearate is to be

taken immediately before meals, only those products with labeling that provides for such administration should be dispensed. Erythromycin stearate tableted products have been designated therapeutically equivalent (AB) in the list, because all of the products produce equivalent blood levels provided the drug is prescribed and administered in accordance with the conditions of use in the labeling. Prescribers and dispensers are advised to be familiar with the labeling of these products.

6. Hydrocortisone Topical Products

A routine FDA quality assurance survey of hydrocortisone products conducted in 1976 revealed a higher than expected frequency of batch failures for topical products. Of 113 batches of hydrocortisone creams, ointments, and lotions tested, 13 batches were found to be outside compendial specifications for potency. The Agency has taken appropriate regulatory action against the defective batches identified, but has not yet completed a new survey of the marketplace. Until subsequent batches of these products are tested, hydrocortisone creams, ointments, and lotions are listed with a BX code (also see errata page for proper coding). Because results from a current survey of these products are expected soon, an early resolution to the status of these products is anticipated.

7. Imipramine HCl Tablets

Within the past year the Agency has determined that certain brands of imipramine tablets may undergo deterioration in the dissolution rate as the tablets age on the shelf, even under normal conditions of storage. The FDA will be proposing to the USP a new dissolution rate standard to solve this problem. Those products that already meet the proposed new standard are coded AB. Products without data to support satisfactory dissolution are coded BP.

8. Nitrofurantoin Tablets and Capsules

A routine FDA quality assurance survey conducted in 1975 revealed a higher than expected rate of failures of nitrofurantoin batches. Of 78 batches tested, nine failed compendial specifications for either potency or dissolution. The Agency has taken appropriate regulatory action against the failing batches which were identified, but until a new survey of the marketplace has been completed, nitrofurantoin solid oral dosage products have been coded in the list as BX. This new survey is now in progress, and an early resolution of the status of these products is anticipated.

9. Prednisone Tablets

Because of known problems of bioinequivalence and therapeutic inequivalence, the USP recently adopted a new in vitro dissolution test correlated

with in vivo bioequivalence data. The FDA is currently conducting a survey of all marketed prednisone tablets to assure that they meet the new USP requirement. When the survey is completed, a determination of therapeutic equivalence can be made. Until then all prednisone products are coded as BX.

10. Prednisolone Tablets

Although FDA sponsored biopharmaceutic studies of prednisolone tablets have not revealed product bioinequivalence, because of the close similarities between prednisolone and prednisone, FDA is not attempting to evaluate the therapeutic equivalence of prednisolone tablets at present. All such tablets are coded as BX pending a review of the dissolution standard for prednisolone tablets.

G. COMMENT, CORRECTION AND UPDATE PROCEDURES

1. Comments

The policies proposed by FDA in this document for evaluating prescription drugs for therapeutic equivalence are open to public comment. A proposal to establish a list such as the one contained in this volume has been published in the Federal Register of January 12, 1979. Persons wishing to present their views should send written comments within the time specified in the Federal Register document to:

Office of the Hearing Clerk
Food and Drug Administration
Room 4-65
5600 Fishers Lane
Rockville, Maryland 20857

The policies proposed in this document are subject to change on the basis of public comments. Any changes in policy will be identified in future editions of this volume.

This list has been reviewed carefully by FDA and is believed to be an accurate list of all active approved NDA's, ANDA's Form 5's, and Form 6's in FDA files as of October 31, 1978. The therapeutic equivalence evaluations on individual products are also believed to reflect accurately the policies proposed in this document. Nevertheless, the list may contain errors, or manufacturers may feel that the proposed policies have been erroneously applied in the evaluation of one or more of their products. Persons wishing to bring errors to the attention of the FDA or to propose a change in any of the individual product evaluations for therapeutic equivalence should do so in writing to the Hearing Clerk at the above address.

2. Updates

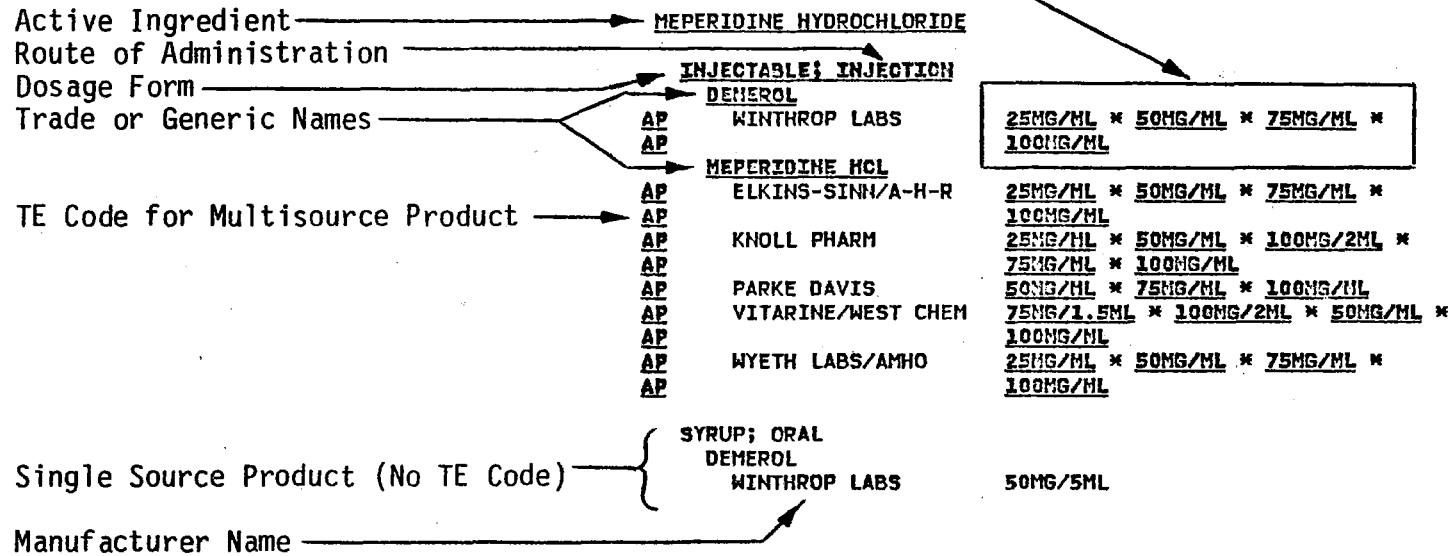

Once the policies have been finalized, the list will be republished in its entirety. Subsequently, FDA anticipates updating the list quarterly. Comments regarding appropriate mechanisms of publication and frequency and format of the revisions are invited.

10

LOXITANE C, LOXAPINE HYDROCHLORIDE
 LUBRICORT, HYDROCORTISONE
 LUFYLLIN, DYPHYLLINE
 LUNGAGGREGATE TC-99M, TECHNETIUM, TC-99M MACROAGGREGATED ALBUMIN
 LYNORAL, ETHINYL ESTRADIOL
 LYSODREN, MITOTANE

** M **

MAA I-131, ALBUMIN, HUMAN SERUM, AGGREGATED, IODINATED, I-131
 MACRODANTIN, NITROFURANTOIN, MACROCRYSTALLINE
 MACRODEX 6% IN DEXTROSE, DEXTRAN 70
 MACRODEX 6% IN NORMAL SALINE, DEXTRAN 70
 MACROTEC, ALBUMIN, HUMAN SERUM, AGGREGATED
 MADRIBON, SULFADIMETHOXINE
 MANDOL, CEFAMANDOLE NAFATE
 MANNITOL, MANNITOL
 MANNITOL 10% W/ DEXTROSE 5% IN DISTILLED WATER, DEXTROSE
 MANNITOL 15% W/ DEXTROSE 5% IN SODIUM CHLORIDE 0.45%, DEXTROSE
 MANNITOL 5% W/ DEXTROSE 5% IN SODIUM CHLORIDE 0.12%, DEXTROSE
 MANNITOL/UROLOGIC, MANNITOL
 MAOLATE, CHLORPHENESIN CARBAMATE
 MARCAINE HCL, BUPIVACAINE HCL
 MARCAINE HCL W/ EPINEPHRINE, BUPIVACAINE HCL
 MAREZINE, CYCLIZINE LACTATE
 MATULANE, PROCARBAZINE HYDROCHLORIDE
 MAXIBOLIN, ETHYLESTRENOL
 MAXIDEX, DEXAMETHASONE
 MECLIZINE HCL, MECLIZINE HYDROCHLORIDE
 MEDIHALER ERGOTAMINE, ERGOTAMINE TARTRATE
 MEDIHALER-ISO, ISOPROTERENOL SULFATE
 MEDROL, METHYLPREDNISOLONE
 MEDROL ACETATE, METHYLPREDNISOLONE ACETATE
 MEFOXIN, SODIUM CEFOXITIN
 MEGACE, MEGESTROL ACETATE
 MELFIAT, PHENDIMETRAZINE TARTRATE
 MELLARIL, THIORIDAZINE HYDROCHLORIDE
 MELLARIL-S, THIORIDAZINE
 MENADIONE, MENADIONE
 MENEST, ESTROGENS, ESTERIFIED
 MENRIUM 10-4, CHLORDIAZEPOXIDE
 MENRIUM 5-2, CHLORDIAZEPOXIDE
 MENRIUM 5-4, CHLORDIAZEPOXIDE
 MEPERGAN, MEPERIDINE HYDROCHLORIDE
 MEPERIDINE AND ATROPINE SULFATE, ATROPINE SULFATE
 MEPERIDINE HCL, MEPERIDINE HYDROCHLORIDE
 MEPHYTON, PHYTONADIONE
 MEPIVACAINE HCL, MEPIVACAINE HYDROCHLORIDE
 MEPIVACAINE HCL W/ LEVONORDEFRIN, LEVONORDEFRIN
 MEPRIAM, MEPROBAMATE
 MEPROBAMATE, MEPROBAMATE
 MEPROSPAN-200, MEPROBAMATE
 MEPROSPAN-400, MEPROBAMATE

MERCURIC NITRATE HG-197, MERCURIC NITRATE, HG-197
 MERSALYL-THEOPHYLLINE, MERSALYL SODIUM
 MESANTOIN, MEPHENYTOIN
 MESTINON, PYRIDOSTIGMINE BROMIDE
 METADEE, VITAMIN D
 METAHYDRIN, TRICHLORMETHIAZIDE
 METANDREN, METHYLTESTOSTERONE
 METARAMINOL BITARTRATE, METARAMINOL BITARTRATE
 METATENSIN, RESERPINE
 METHADONE HCL, METHADONE HYDROCHLORIDE
 METHADOSE, METHADONE HYDROCHLORIDE
 METHAMPEX, METHAMPHETAMINE HYDROCHLORIDE, D-(+)
 METHAMPHETAMINE, METHAMPHETAMINE HYDROCHLORIDE
 METHAMPHETAMINE HCL, METHAMPHETAMINE HYDROCHLORIDE
 METHAPYRILENE HCL, METHAPYRILENE HYDROCHLORIDE
 METHAZINE, PROMETHAZINE HYDROCHLORIDE
 METHERGINE, METHYLERGONOVINE MALEATE
 METHOCARBAMOL, METHOCARBAMOL
 METHOSARB, CALUSTERONE
 METHOTREXATE, METHOTREXATE
 METHSCOPOLAMINE BROMIDE, METHSCOPOLAMINE BROMIDE
 METHYLPHENIDATE HCL, METHYLPHENIDATE HYDROCHLORIDE
 METHYLPREDNISOLONE, METHYLPREDNISOLONE
 METHYLTESTOSTERONE, METHYLTESTOSTERONE
 METICORTELONE ACETATE, PREDNISOLONE ACETATE
 METICORTEN, PREDNISONE
 METOPIRONE, METYRAPONE
 METOPIRONE TARTRATE, METYRAPONE TARTRATE
 METRA, PHENDIMETRAZINE TARTRATE
 METRASPRAY, TETRACAINE
 METROPINE, METHYLATROPINE NITRATE
 METUBINE IODIDE, METOCURINE IODIDE
 MICATIN, MICONAZOLE NITRATE
 MICRAININ, ASPIRIN
 MICRONOR, NORETHINDRONE
 MICROSUL, SULFAMETHIZOLE
 MILONTIN, PHENSUXIMIDE
 MILTOWN, MEPROBAMATE
 MINIPRESS, PRAZOSIN HYDROCHLORIDE
 MINITEC, SODIUM PERTECHNETATE, TC-99M
 MINOCIN, MINOCYCLINE HYDROCHLORIDE
 MINTEZOL, THIABENDAZOLE
 MIOCHOL, ACETYLCHOLINE CHLORIDE
 MIRADON, ANISINDIONE
 MITHRACIN, MITHRAMYCIN
 MOBAN, MOLINDONE HYDROCHLORIDE
 MODERIL, RESCINNAMINE
 MODICON, ETHINYL ESTRADIOL
 MODICON 28, ETHINYL ESTRADIOL
 MONISTAT, MICONAZOLE
 MONISTAT-7, MICONAZOLE NITRATE
 MOTOFEN, ATROPINE SULFATE
 MOTOFEN HALF-STRENGTH, ATROPINE SULFATE

TRADE NAME INDEX

11

MOTRIN, IBUPROFEN
 MPI STANNOUS DIPHOSPHONATE, ETIDRONATE DISODIUM
